Ansible Automation

➢ Ansible Modules are discrete units of code that can be used from the command line or in a playbook task.

➢ Ansible executes each module, usually on the remote managed node, and collects return values.

➢ **SetUp Module -**
   ○ Used to get Facts while executing Ansible Playbooks.
   ○ Module is automatically called by playbooks to get the Information about the Remote Host/Ansible Clients.

Thank You...

Don't be the Same! Be Better!!!
